Hello, I wanted to help shine some light on why vaccinated individuals are coming down with the mumps.

Attached you will find legal documents detailing the "Chatom vs. Merck" case. This is a "Anti-trust" lawsuit brought against Merck, the maker of the only MMR vaccine available in the US.

As you will see in these court documents, 2 of Merck's own scientists have come forward stating that Merck has engaged in outright fraud to in an attempt to deceive people. The Mumps portion of their vaccine was ineffective and thus to gain FDA approval the company ordered their scientists to first attempt using the vaccine strain of the mumps, which because it was not the wild virus, this would artificially inflate the appearance of "effectiveness." After this failed to provide the needed efficacy results, Merck's scientists then used animal blood to, again, artificially create the appearance of effectiveness. Furthermore, even after these 2 previous nefarious attempts were made to deceive the medical/scientific communities and the public the company then simply lied about their efficacy numbers.

I believe you will find this information helpful in reporting the central issue at hand with these cases of mumps occurring in highly vaccinated or completely vaccinated populations. I will look forward to hearing back from you and seeing your future news reports that will help the public understand what is truly behind these mumps outbreaks.

Sincerely,

Dr. Dale Brown
